

7.1 Grouping data: struct

Sometimes two data items are really aspects of the same data. For example, time might be recorded in hours and minutes, as in 4 hours and 23 minutes. Or a point on a plot might be recorded as $x = 5$, $y = 7$. Storing such data in separate variables, such as `runTimeHours` and `runTimeMinutes`, is not as clear as grouping that data into a single variable, like `runTime`, which might have subitems `runTime.hours` and `runTime.minutes`.

PARTICIPATION ACTIVITY

7.1.1: Naturally grouped data.

- 1) Select the pair forming part of a person's height (in U.S. units)
 - ☐ Feet and inches
 - ☐ Inches and salary
 - ☐ Pounds and ounces
- 2) Select the group of items indicating the change provided to a person who pays for a meal.
 - ☐ Ounce, gill, pint, quart, and gallon
 - ☐ Mile, furlong, yard, feet, and inches
 - ☐ Dollars, quarters, dimes, nickels, and pennies

The **struct** construct defines a new type, which can be used to declare a variable with subitems. The following animation illustrates.

PARTICIPATION ACTIVITY

7.1.2: A struct enables creating a variable with data members.

Animation content:

Code snippet is as follows:

```
typedef struct TimeHrMin_struct {  
    int hourValue;
```

```

    int minuteValue;
} TimeHrMin;

...

TimeHrMin runTime1;
TimeHrMin runTime2;
TimeHrMin runTime3;

runTime1.hourValue = 5;
runTime1.minuteValue = 46;
runTime3.hourValue = runTime1.hourValue;

```

©zyBooks 04/05/18 21:45 261830
 Julian Chan
 WEBERCS2250ValleSpring2018

Final memory contents is as follows:

```

96 (runTime1's hourValue): 5
97 (runTime1's hourValue): 46
98 (runTime2's hourValue): ?
99 (runTime2's hourValue): ?
100 (runTime3's hourValue): 5
101 (runTime3's hourValue): ?
102: empty

```

Animation captions:

1. The struct construct just declares new type; no memory is allocated.
2. Variable definitions allocate memory for each object's member.
3. Accesses refer to an object member's memory location.

The programmer uses struct to defines and use a new type as follows.

Construct 7.1.1: Defining and using a new struct type.

```

typedef struct StructTypeName_struct {
    type item1;
    type item2;
    ...
    type itemN;
} StructTypeName;

...
StructTypeName myVar;

myVar.item1 = ...

```

©zyBooks 04/05/18 21:45 261830
 Julian Chan
 WEBERCS2250ValleSpring2018

The above uses a common combination of a typedef definition with a struct definition. A **typedef** defines a new type name for an existing type. This material uses that combination exclusively

and does not discuss typedef definition separately.

The `struct StructTypeName_struct { ... }` part defines a new struct type named `struct StructTypeName_struct`. The typedef part defines a new type name named `StructTypeName` that is synonymous with `struct StructTypeName_struct`.

A programmer can use `StructTypeName` to declare a variable of that struct type as in the statement `StructTypeName myVar;`.

Each `type` may be any type like `int` or `char`. Each struct subitem is called a **data member**. For a declared variable, each struct data member can be accessed using `.`, known as a **member access** operator, sometimes called **dot notation**.

Assigning a variable of a struct type to another such variable automatically assigns each corresponding data member, as shown below.

PARTICIPATION ACTIVITY

7.1.3: Assigning a struct type.

Animation content:

Code snippet is as follows:

```
typedef struct TimeHrMin_struct {
    int hourValue;
    int minuteValue;
} TimeHrMin;
```

...

```
TimeHrMin runTime1;
TimeHrMin runTime2;
TimeHrMin runTime3;
```

```
runTime1.hourValue = 5;
runTime1.minuteValue = 46;
runTime2 = runTime1;
```

Final memory contents is as follows:

```
96 (runTime1's hourValue): 5
97 (runTime1's hourValue): 46
98 (runTime2's hourValue): ?
99 (runTime2's hourValue): ?
100 (runTime3's hourValue): 5
101 (runTime3's hourValue): ?
102: empty
```

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

Animation captions:

1. Assigning a variable of a struct type to another such variable automatically assigns each corresponding data member.

Forgetting to include the semicolon at the end of a struct definition will generate cryptic compilation errors:

©zyBooks 04/05/18 21:45 261830

Julian Chan

WEBERCS2250ValleSpring2018

Figure 7.1.1: Less-than-helpful error message when forgetting the semicolon at the end of a struct definition.

```
gcc -Wall testfile.c
testfile.c:6: error: two or more data types in declaration specifiers
testfile.c:6: warning: return type of 'main' is not 'int'
testfile.c: In function 'main':
testfile.c:7: error: incompatible types in return
testfile.c:8: warning: control reaches end of non-void function
```

Try 7.1.1: Internet search for clues of error message cause.

Do an Internet search by copying and pasting the following (from the second line of the above figure):

error: two or more data types in declaration specifiers

Then, read over the first 3 search results, particularly focusing on the reply messages to find clues to the error message's cause.

PARTICIPATION ACTIVITY

7.1.4: The struct construct.

- 1) A struct definition for CartesianPoint has subitems int x and int y. How many int locations in memory does the struct definition allocate?

**CHALLENGE
ACTIVITY**

7.1.1: Defining a struct.

Define a struct named PatientData that contains two integer data members named heightInches and weightPounds. Sample output for the given program:

Patient data: 63 in, 115 lbs

```
1 #include <stdio.h>
2
3 /* Your solution goes here */
4
5 int main(void) {
6     PatientData lunaLovegood;
7
8     lunaLovegood.heightInches = 63;
9     lunaLovegood.weightPounds = 115;
10
11     printf("Patient data: %d in, %d lbs\n", lunaLovegood.heightInches, lunaLovegood.weightPounds);
12
13     return 0;
14 }
```

Run[View your last submission](#) ▼

Julian Chan

WEBERCS2250ValleSpring2018

**CHALLENGE
ACTIVITY**

7.1.2: Accessing a struct's data members.

Write a statement to print the data members of InventoryTag. End with newline. Ex: if itemID is 314 and quantityRemaining is 500, print:

Inventory ID: 314, Qty: 500

```
1 #include <stdio.h>
2
3 typedef struct InventoryTag_struct {
4     int itemID;
5     int quantityRemaining;
6 } InventoryTag;
7
8 int main(void) {
9     InventoryTag redSweater;
10
11     redSweater.itemID = 314;
12     redSweater.quantityRemaining = 500;
13
14     /* Your solution goes here */
15
16     return 0;
17 }
```

Julian Chan
WEBERCS2250ValleSpring2018

Run

7.2 Structs and functions

The struct construct's power is evident when used with functions. A struct can be used to return multiple values. The following illustrates. Although `ConvHrMin()` has two output values, the struct type allows the function to return a single item, avoiding a less-clear approach using two pass by reference parameters.

PARTICIPATION ACTIVITY

7.2.1: Using a struct that is returned from a function; the struct's data members are copied upon return.

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

Animation content:

Code snippet is as follows:

```
#include
using namespace std;
```

```

struct TimeHrMin {
    int hourValue;
    int minuteValue;
};

TimeHrMin ConvHrMin(int totalTime) {
    TimeHrMin timeStruct;

    timeStr.hourValue = totalTime / 60;
    timeStr.minuteValue = totalTime % 60;

    return timeStruct;
}

int main() {
    int inTime;
    TimeHrMin travelTime;

    cout << "Enter total minutes: ";
    cin >> inTime;

    travelTime = ConvHrMin(inTime);

    cout << "Equals: ";
    cout << travelTime.hourValue << " hrs ";
    cout << travelTime.minuteValue << " mins";

    return 0;
}

```

Final memory contents is as follows:

```

96 (main's inTime): 156
97 (main's travelTime hourValue): 2
98 (main's's travelTime hourValue): 36
99: empty
100 (ConvHrMin's totTime): 156
101 (ConvHrMin's timeStruct hourValue): 2
102 (ConvHrMin's timeStruct minuteValue): 36

```

©zyBooks 04/05/18 21:45 261830
 Julian Chan
 WEBERCS2250ValleSpring2018

©zyBooks 04/05/18 21:45 261830
 Julian Chan
 WEBERCS2250ValleSpring2018

Animation captions:

1. The program prompts a user to enter travel time in minutes, then calls the ConvHrMin function to convert travel time to hours and minutes.

2. Upon return, timeStruct's data members are copied to main's travelTime variable.
3. Returning a struct type allows the ConvHrMin function to return a single item, avoiding a less-clear approach of using two pass-by-reference parameters.

**PARTICIPATION
ACTIVITY**
7.2.2: Monetary change program.

Complete the program to compute monetary change, using the largest coins possible.

7.3 Structs and arrays

The power of structs becomes even more evident when used in conjunction with arrays.

Consider a TV watching time program where a user can enter a country name, and the program outputs the daily TV watching hours average for a person in that country. One approach uses two same-sized arrays, one to hold names, and the other to hold numbers corresponding to each name. Instead of those two arrays, a struct allows for declaration of just one array that stores items that each have name and number data members.

Figure 7.3.1: An array of struct items rather than two arrays of more basic types.

```
Enter country name: U.S.A.  
People in U.S.A. watch  
283 minutes of TV daily.  
...  
Enter country name: UK  
Country not found, try  
again.  
...  
Enter country name: U.K.  
People in U.K. watch  
242 minutes of TV daily.
```

```

#include <stdio.h>
#include <string.h>
#include <stdbool.h>

const int MAX_COUNTRY_NAME_LENGTH = 50;

typedef struct CountryTvWatch_struct {
    char countryName[50];
    int tvMinutes;
} CountryTvWatch;

int main(void) {
    // Source: www.statista.com, 2010
    const int NUM_COUNTRIES = 4;

    CountryTvWatch countryList[NUM_COUNTRIES];
    char countryToFind[MAX_COUNTRY_NAME_LENGTH];
    bool countryFound = false;
    int i = 0;

    strcpy(countryList[0].countryName, "Brazil");
    countryList[0].tvMinutes = 222;
    strcpy(countryList[1].countryName, "India");
    countryList[1].tvMinutes = 119;
    strcpy(countryList[2].countryName, "U.K.");
    countryList[2].tvMinutes = 242;
    strcpy(countryList[3].countryName, "U.S.A.");
    countryList[3].tvMinutes = 283;

    printf("Enter country name: ");
    scanf("%s", countryToFind);

    countryFound = false;
    for (i = 0; i < NUM_COUNTRIES; ++i) { // Find country's index
        if (strcmp(countryList[i].countryName, countryToFind) == 0)
        {
            countryFound = true;
            printf("People in %s watch\n", countryToFind);
            printf("%d minutes of TV daily.\n",
countryList[i].tvMinutes);
        }
        if (!countryFound) {
            printf("Country not found, try again.\n");
        }
    }

    return 0;
}

```

©zyBooks 04/05/18 21:45 261830
 Julian Chan
 WEBERCS2250ValleSpring2018

Note that the `countryList` variable is declared as `CountryTvWatch countryList[NUM_COUNTRIES]`, meaning an array of items of type `CountryTvWatch`. Thus, each array element will have memory allocated for the struct's two data members, `countryName` and `tvMinutes`.

©zyBooks 04/05/18 21:45 261830
 Julian Chan
 WEBERCS2250ValleSpring2018

The notation `countryList[i].countryName` is equivalent to `(countryList[i]).countryName`, because the member access operator is evaluated left-to-right (as are any equal-precedence operators). The left-to-right member access operator evaluation is well-known among programmers so parentheses are typically omitted.

- 1) Declare the array countryList of 5 CountryTvWatch elements

[Check](#)[Show answer](#)

- 2) Given an array countryList consisting of 5 CountryTvWatch struct elements, write a statement that assigns the value of the 0th element's tvMinutes data member to the variable countryMin.

[Check](#)[Show answer](#)

- 3) Given an array countryList consisting of 5 CountryTvWatch struct elements, write one statement that copies element 4's struct values to element 0's.

[Check](#)[Show answer](#)

7.4 Structs, arrays, and functions: A seat reservatic

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

A programmer commonly uses structs, arrays, and functions together. Consider a program that allows a reservations agent to reserve seats for people, useful for a theater, an airplane, etc. The below program defines a Seat struct whose data members are a person's first name, last name, and the amount paid for the seat. The program declares an array of 5 seats to represent the theater, airplane, etc., initializes all seats to being empty (indicated by a first name of "empty"), and then allows a user to enter commands to print all seats, reserve a seat, or quit.

Figure 7.4.1: A seat reservation system involving a struct, arrays, and functions.

```

#include <stdio.h>
#include <string.h>
#include <stdbool.h>

typedef struct Seat_struct {
    char firstName[50];
    char lastName[50];
    int amountPaid;
} Seat;

/** Functions for Seat */

void SeatMakeEmpty(Seat* seat) {
    strcpy((*seat).firstName, "empty");
    strcpy((*seat).lastName, "empty");
    (*seat).amountPaid = 0;

    return;
}

bool SeatIsEmpty(Seat seat) {
    return (strcmp(seat.firstName, "empty") == 0);
}

void SeatPrint(Seat seat) {
    printf("%s ", seat.firstName);
    printf("%s, ", seat.lastName);
    printf("Paid: %d\n", seat.amountPaid);

    return;
}

/** End functions for Seat */

/** Functions for array of Seat */
void SeatsMakeEmpty(Seat seats[], int numSeats) {
    int i = 0;

    for (i = 0; i < numSeats; ++i) {
        SeatMakeEmpty(&seats[i]);
    }

    return;
}

void SeatsPrint(Seat seats[], int numSeats) {
    int i = 0;

    for (i = 0; i < numSeats; ++i) {
        printf("%d: ", i);
        SeatPrint(seats[i]);
    }

    return;
}

/** End functions for array of Seat */

int main(void) {
    const int NUM_SEATS = 5;
    char userKey = '-';
    int seatNum = 0;
    Seat allSeats[NUM_SEATS];
    Seat currSeat;

    SeatsMakeEmpty(allSeats, NUM_SEATS);

    while (userKey != 'q') {
        printf("Enter command (p/r/q): ");

```

```

 Julian Chan
 WEBERCS2250ValleSpring2018

The programmer first defined several functions related to the Seat struct, such as checking if a seat is empty or printing a seat. The programmer then defined some functions related to an array of seat items. To distinguish, the programmer named the former starting with Seat and the latter starting with Seats.

The SeatMakeEmpty() function uses pass by pointer to update the information within an individual seat. Remember that to update a variable passed by pointer, the program must use the dereference operator * to access the value pointed to by the pointer. When the variable is a pointer to a structure, both the dereference operator and the member access operators must be used together. In this case, the member access operator has precedence, so parentheses are used to dereference the pointer first:

©zyBooks 04/05/18 21:45 261830
 Julian Chan
 WEBERCS2250ValleSpring2018

Construct 7.4.1: Dereferencing a pointer to a struct.

```
(*variableName).memberName
```

The programmer left a "FIXME" comment indicating that the program also requires the ability to delete a reservation. That functionality is straightforward to introduce, just requiring the user to enter a seat number and then making use of the existing `SeatMakeEmpty()` function.

Notice how `main()` is relatively clean, dealing mostly with the user commands, and then using functions to carry out the appropriate work. Actually, the "reserve seat" command could be improved; `main()` currently fills the reservation information (e.g., "Enter first name..."), but `main()` would be cleaner if it just called a function as `SeatFillReservationInfo(&currSeat)`.

The seat reservation program loses all its information when exited. An improvement is to save all reservation information in a file. Commands 's' and 'g' would save and get information to/from a file, respectively.

**PARTICIPATION
ACTIVITY**

7.4.1: Seat reservation example with struct, array, and functions.

Refer to the above example.

1) The number of seats is 5.

- ☐ True
☐ False

2) `SeatsMakeEmpty()` has a loop that sets each seat in the `seats` array to have a first name of "empty".

- ☐ True
☐ False

3) `SeatsIsEmpty()` checks if all the seats in the array are empty.

- ☐ True
☐ False

4) Deleting a reservation would reduce the array size from 5 down to 4.

- ☐ True
☐ False

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

**PARTICIPATION
ACTIVITY**

7.4.2: Introduce delete behavior to the reservation program.

Modify `main()` to allow the user to enter command 'd', followed by the user entering a seat number. Call `SeatMakeEmpty()` to delete the seat.

[Load default template...](#)

```
1
2 #include <stdio.h>
3 #include <string.h>
4 #include <stdbool.h>
5
6 typedef struct Seat_struct {
7     char firstName[50];
8     char lastName[50];
9     int amountPaid;
10 } Seat;
11
12 /** Functions for Seat */
13
14 void SeatMakeEmpty(Seat* seat) {
15     strcpy((*seat).firstName, "empty");
16     strcpy((*seat).lastName, "empty");
17     (*seat).amountPaid = 0;
18
19     return;
```

7.5 Separate files for structs

Programmers typically put all code for a struct into two files, separate from other code.

Table 7.5.1: Typical two files per struct.

StructName.h	Contains the struct definition, including data members and related function declarations.
StructName.c	Contains related function definitions.

A file that uses the struct, such as a main file or StructName.c, must include StructName.h. The .h file's contents are sufficient to allow compilation, as long as the corresponding .c file is eventually compiled into the program too.

Figure 7.5.1: Using two separate files for a struct.

File: StoreItem.h	File: StoreItem.c
-------------------	-------------------

```
#ifndef STOREITEM_H
#define STOREITEM_H

typedef struct StoreItem_struct {
    int weightOunces;
    // (other fields omitted for brevity)
} StoreItem;

void StoreItemSetWeightOunces
    (StoreItem* storeItem, int
weightOunces);
void StoreItemPrint(StoreItem
storeItem);

#endif
```

```
#include <stdio.h>
#include "StoreItem.h"

void StoreItemSetWeightOunces
    (StoreItem* storeItem, int weightOunces)
{
    storeItem->weightOunces = weightOunces;
    return;
}

void StoreItemPrint(StoreItem storeItem){
    printf("Weight (ounces): %d\n",
storeItem.weightOunces);
    return;
}
```

File: main.c

```
#include <stdio.h>
#include "StoreItem.h"

int main() {
    StoreItem item1;

    StoreItemSetWeightOunces(&item1,
16);
    StoreItemPrint(item1);

    return 0;
}
```

Compilation example

```
% gcc -Wall -Wextra -std=c99 -pedantic StoreItem.c
main.c
% a.out
Weight (ounces): 16
```

The figure shows how all the .c files might be listed when compiled into one program. Note that the .h file is *not* one of the listed files, as it is included in the appropriate .c files.

Sometimes multiple small related structs are grouped into a single file, to avoid a proliferation of files. But for typical structs, good practice is to create a unique .c and .h file for each struct.

For independent development and faster compilation, each struct file is typically compiled individually into an object file, and then later linked with a main file. Such compilation is discussed in another section on modular compilation.

PARTICIPATION ACTIVITY

7.5.1: Separate files.

- 1) Commonly a struct definition and associated function definitions are contained entirely in their own .h file.

- ☐ True
☐ False

- 2) The .c file for a struct should #include the associated .h file.

- ☐ True

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

☐ False

3) A drawback of the separate file approach is longer compilation times.

☐ True

☐ False

©zyBooks 04/05/18 21:45 261830

Julian Chan

WEBERCS2250ValleSpring2018

7.6 Ch 7 Warm up: Online shopping cart (C)

(1) Create three files to submit:

- ItemToPurchase.h - Struct definition and related function declarations
- ItemToPurchase.c - Related function definitions
- main.c - main() function

Build the ItemToPurchase struct with the following specifications:

- Data members (3 pts)
 - char itemName []
 - int itemPrice
 - int itemQuantity
- Related functions
- MakeItemBlank() (2 pts)
 - Has a pointer to an ItemToPurchase parameter.
 - Sets item's name = "none", item's price = 0, item's quantity = 0
- PrintItemCost()
 - Has an ItemToPurchase parameter.

Ex. of PrintItemCost() output:

```
Bottled Water 10 @ $1 = $10
```

©zyBooks 04/05/18 21:45 261830

Julian Chan

WEBERCS2250ValleSpring2018

(2) In main(), prompt the user for two items and create two objects of the ItemToPurchase struct. Before prompting for the second item, call **fflush(stdin)**; to allow the user to input a new string. (2 pts)

Ex:

```
Item 1
Enter the item name:
Chocolate Chips
Enter the item price:
3
Enter the item quantity:
1
```

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

```
Item 2
Enter the item name:
Bottled Water
Enter the item price:
1
Enter the item quantity:
10
```

(3) Add the costs of the two items together and output the total cost. (2 pts)

Ex:

```
TOTAL COST
Chocolate Chips 1 @ $3 = $3
Bottled Water 10 @ $1 = $10

Total: $13
```

7.7 Ch 7 Program: Online shopping cart (continued)

This program extends the earlier "Online shopping cart" program. (Consider first saving your earlier program).

(1) Extend the ItemToPurchase struct to contain a new data member. (2 pt)

- char itemDescription[] - set to "none" in MakeItemBlank()

Implement the following related functions for the ItemToPurchase struct.

- PrintItemDescription()
- Has an ItemToPurchase parameter.

Ex. of PrintItemDescription() output:

```
Bottled Water: Deer Park, 12 oz.
```

(2) Create three new files:

- ShoppingCart.h - struct definition and related function declarations
- ShoppingCart.c - related function definitions
- main.c - main() function (Note: main()'s functionality differs from the warm up)

Build the ShoppingCart struct with the following data members and related functions. Note: Some can be function stubs (empty functions) initially, to be completed in later steps.

- Data members (3 pts)
- char customerName []

- char currentDate []
- ItemToPurchase cartItems [] - has a maximum of 10 slots (can hold up to 10 items of any quantity)
- int cartSize - the number of filled slots in array (number of items in cart of any quantity)
- Related functions
- AddItem()
 - Adds an item to cartItems array. Has parameters ItemToPurchase and ShoppingCart. Returns ShoppingCart object.
- RemoveItem()
 - Removes item from cartItems array (does not just set quantity to 0; removed item will not take up a slot in array). Has a char[] (an item's name) and a ShoppingCart parameter. Returns ShoppingCart object.
 - If item name cannot be found, output this message: **Item not found in cart. Nothing removed.**
- ModifyItem()
 - Modifies an item's description, price, and/or quantity. Has parameters ItemToPurchase and ShoppingCart. Returns ShoppingCart object.
- GetNumItemsInCart() (2 pts)
 - Returns quantity of all items in cart. Has a ShoppingCart parameter.
- GetCostOfCart() (2 pts)
 - Determines and returns the total cost of items in cart. Has a ShoppingCart parameter.
- PrintTotal()
 - Outputs total of objects in cart. Has a ShoppingCart parameter.
 - If cart is empty, output this message: **SHOPPING CART IS EMPTY**
- PrintDescriptions()
 - Outputs each item's description. Has a ShoppingCart parameter.

Ex. of PrintTotal() output:

```
John Doe's Shopping Cart - February 1, 2016
Number of Items: 8

Nike Romaleos 2 @ $189 = $378
Chocolate Chips 5 @ $3 = $15
Powerbeats 2 Headphones 1 @ $128 = $128

Total: $521
```

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

Ex. of PrintDescriptions() output:

```
John Doe's Shopping Cart - February 1, 2016
```

```
Item Descriptions
Nike Romaleos: Volt color, Weightlifting shoes
Chocolate Chips: Semi-sweet
Powerbeats Headphones: Bluetooth headphones
```

(3) In `main()`, prompt the user for a customer's name and today's date. Output the name and date. Create an object of type `ShoppingCart`. (1 pt)

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

Ex.

```
Enter Customer's Name:
John Doe
Enter Today's Date:
February 1, 2016

Customer Name: John Doe
Today's Date: February 1, 2016
```

(4) Implement the `PrintMenu()` function. `PrintMenu()` has a `ShoppingCart` parameter, and outputs a menu of options to manipulate the shopping cart. Each option is represented by a single character. Build and output the menu within the function.

If the an invalid character is entered, continue to prompt for a valid choice. *Hint: Implement Quit before implementing other options.* Call `PrintMenu()` in the `main()` function. Continue to execute the menu until the user enters `q` to Quit. (3 pts)

Ex:

```
MENU
a - Add item to cart
r - Remove item from cart
c - Change item quantity
i - Output items' descriptions
o - Output shopping cart
q - Quit

Choose an option:
```

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

(5) Implement the "Output shopping cart" menu option. (3 pts)

Ex:

OUTPUT SHOPPING CART

John Doe's Shopping Cart - February 1, 2016

Number of Items: 8

Nike Romaleos 2 @ \$189 = \$378

Chocolate Chips 5 @ \$3 = \$15

Powerbeats Headphones 1 @ \$128 = \$128

Total: \$521

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

(6) Implement the "Output item's description" menu option. (2 pts)

Ex.

OUTPUT ITEMS' DESCRIPTIONS

John Doe's Shopping Cart - February 1, 2016

Item Descriptions

Nike Romaleos: Volt color, Weightlifting shoes

Chocolate Chips: Semi-sweet

Powerbeats Headphones: Bluetooth headphones

(7) Implement "Add item to cart" menu option. (3 pts)

Ex:

ADD ITEM TO CART

Enter the item name:

Nike Romaleos

Enter the item description:

Volt color, Weightlifting shoes

Enter the item price:

189

Enter the item quantity:

2

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

(8) Implement the "Remove item from cart" menu option. (4 pts)

Ex:

```
REMOVE ITEM FROM CART
Enter name of item to remove:
Chocolate Chips
```

(9) Implement "Change item quantity" menu option. *Hint: Make new ItemToPurchase object before using ModifyItem() function.* (5 pts)

©zyBooks 04/05/18 21:45 261830
Julian Chan
WEBERCS2250ValleSpring2018

Ex:

```
CHANGE ITEM QUANTITY
Enter the item name:
Nike Romaleos
Enter the new quantity:
3
```
